The port owns and maintains its own water system that serves tenants, public restrooms, vessels that call on the Port of Vancouver and several of our offices. The water system is comprised of three major wells that fill two large water storage tanks used to temporarily store the water that is pumped from the wells. The total storage capacity of the two tanks is around 350,000 gallons. The system also provides fire suppression in warehouses in the event of a fire. We have three state certified employees who are responsible for daily monitoring and maintenance of the equipment and system. We also have a cross-departmental team of professionals that developed an emergency response plan and performs annual response drills to prepare for water system emergencies.

Our water system is regulated by the Washington Department of Health and regular testing is conducted to measure for more than 75 contaminants.
Sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals. In some cases, water may also pick up radioactive material and substances resulting from human activity or the presence of animals.

Source water contaminants may include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife;
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming;
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff and residential uses;
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production and can also come from gas stations, urban storm water runoff and septic systems;
- Radioactive contaminants, which can be naturally occurring or the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) and/or the Washington State Board of Health prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration and/or Washington State Department of Agriculture regulations establish limits for contaminants in bottled water that must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline at 800-426-4791 or visiting epa.gov/ground-water-and-drinking-water.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.

When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

### Immuno-Compromised Persons

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available through the Safe Drinking Water Hotline at 800-426-4791.

### Protecting the Water Supply

We were one of the first U.S. ports to implement a drinking water Environmental Management System with a comprehensive approach to drinking water protection and contamination prevention. The port’s water system provides clean drinking water for industrial tenants, marine vessels, irrigation and fire protection, meeting state and federal health standards.
Water Quality Results 2020

The Port of Vancouver tested samples for more than 75 individual contaminants in 2020. The table below summarizes the levels of regulated substances detected. All detections were below levels allowed by federal and state agencies. The water quality information presented in the table is from testing performed according to regulations. All data shown were collected during the last calendar year unless otherwise noted.

* Concentration which, if exceeded, triggers treatment or other requirements
** 90 percent of the samples were less than the value shown, so no action
*** The port tested for these contaminants within the last three years as required by state regulation

WATER TERMS AND DEFINITIONS

The port maintains a “Group A” Non-Transient/Non-Community (NTNC) potable water system which is regulated under Washington Administrative Code (WAC) Chapter 290 by the Washington State Department of Health (WDOH), Division of Drinking Water. As a precautionary measure, all drinking water supplied by the port is treated with chlorine to help remove some potential contaminants. For more information about groundwater, contact the WDOH at 800-525-0127.

MAXIMUM CONTAMINANT LEVEL (MCL)
The highest level of a contaminant that is allowed in drinking water.

MAXIMUM CONTAMINANT LEVEL GOAL (MCLG)
The level of contaminant in drinking water below which there is no known or expected health risk.

ppb
Parts per billion

ppm
Parts per million

Port of Vancouver USA
Water System Upgrades Nearly Complete

Since 2018, the port has been working to modernize its internal water system. Port tenants and fire systems are served by the water system and due to the system’s substantial span and complexity, a phased approach was best suited.

First steps took place in March 2018, when port contractors removed a 120-foot, 100,000-gallon water tower that had stood as one of the tallest structures in Clark County for nearly 90 years. Next, crews completed excavation for the new at-grade 250,000-gallon tank’s foundation, relocated utilities and assembled the new tank.

The existing gaseous chlorination system used to disinfect potable water is being replaced with an on-site sodium hypochlorite generation (OSHG) system. Chlorination is the process of adding chlorine to drinking water to disinfect it and kill germs. Different processes can be used to achieve safe levels of chlorine in drinking water and this new system will improve functionality and overall safety as well.

The project’s final phase is scheduled for fall 2022 in which crews will install a backup power generator to replace the existing diesel driven pump to improve the resiliency and dependability of the water system.
